How can I configure CuteFTP to open links on a remote server as virtual directories instead of trying to download them as folders?

THE INFORMATION IN THIS ARTICLE APPLIES TO:

- CuteFTP Pro® all versions
- CuteFTP® Home all versions

QUESTION

How can I configure CuteFTP to open links on a remote server as virtual directories instead of trying to download them as folders?

ANSWER

What you are referring to are *symbolic links*. Symbolic links are similar to shortcuts, in that they point to items in other locations on a server. Use the procedure below to configure the way that CuteFTP handles symbolic links.

To configure link options

- 1. On the main menu, click **Tools**, then click **Global Options** (or press ALT+F7).
- 2. Expand the **Navigation** node, then click **Links**. The **Links** options appear.
- In the Server side link resolution area, ensure the Attempt link resolution using LIST-L command check box is not selected. Clearing the check box sends the LIST command to display the folder contents.
- 4. Select the **Always assume the link is a folder (don't attempt to resolve)** check box to treat symbolic links as folders that you can double-click to see the folder's contents.

CuteFTP attempts to show the actual path of a file or folder link in the **Remote** pane, in the **Name** column. For example, a link to a file called **archive.zip** might display as **.3/networks/bbs_info/archive.zip**.

5. Click **OK** to save changes and close the **Global Options** dialog box.

For more information, refer to <u>Configuring How CuteFTP Handles Symbolic Links</u> in the CuteFTP help.
