

Command variables not being passed correctly in Event Rules

THE INFORMATION IN THIS ARTICLE APPLIES TO:

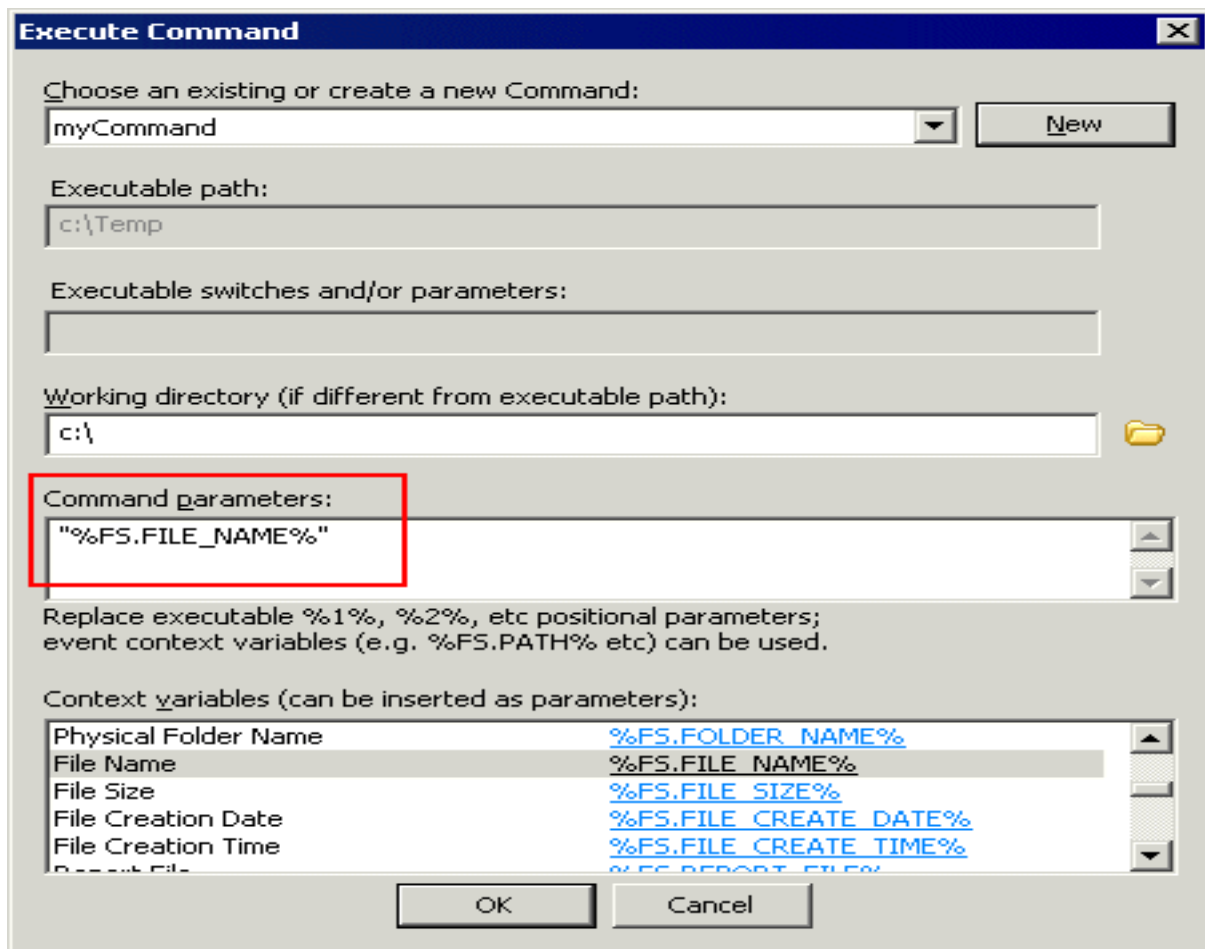

- EFT Server (All versions)

SYMPTOM

Command variables are not being passed correctly in Event Rules.

RESOLUTION

EFT Server passes the complete variable along to the command; however, due to limitations of some command line applications, they may not be able to interpret the command properly. In certain instances, such as when there is a semicolon in a file name, you may need to enclose the variable in quotation marks in the **Command Parameters** box after you insert it from the **Context variables** box.

Command variables not being passed correctly in Event Rules

For details of executing a command in an Event Rule, refer to [the online help](#) for your version of EFT.
