

Use Alternative LDAP Attribute for Internal User's Email Address

THE INFORMATION IN THIS ARTICLE APPLIES TO:

- Mail Express, v3.0 and later

DISCUSSION

Mail Express uses the "mail" LDAP attribute from Active Directory to populate the email address property for internal users. If you want to use an alternative LDAP attribute to define a user's email address, you must do so by modifying a value in the **staticConfig.xml** file, as described below.

To use an alternative LDAP attribute to define an internal user's email address

1. Stop the Mail Express service.
2. In the Mail Express installation directory, open the **META-INF** directory (e.g., **\Program Files\GlobalSCAPE\Mail Express\webapps\ROOT\WEB-INF\classes\META-INF** or **\Program Files (x86)\GlobalSCAPE\Mail Express\webapps\ROOT\WEB-INF\classes\META-INF**).
3. Locate the file **staticConfig.xml** and open it in a text editor.
4. Locate **MailExpressLDAP.attributeNameMail**.
5. Change `value="mail"` to `value="description"`.
6. Save and close the file.
7. Start the Mail Express service.
