Disallow (Shut Off) Basic Authentication for HTTPS

THE INFORMATION IN THIS ARTICLE APPLIES TO:

- EFT v7.4.11 and later

DISCUSSION

EFT's web client uses form-based authentication. Basic auth is provided to remain compliant with RFC 7617. As added assurance that best practices are followed, EFT administrators can force use of HTTPS for all connections.

EFT v8.0 and later store Advanced Properties in a JSON file. When you upgrade from EFT v7.4.x to EFT v8, the non-default settings that you have defined in the registry will be added to the Advanced Properties file during upgrade. (Default settings become part of the EFT configuration files.) For a more on how to use advanced properties, and a spreadsheet of the advanced properties, please refer to the "Advanced Properties" topic in the help for your version of EFT.

You can disallow (shut off) basic authentication for HTTPS using the advanced property below. This advanced property was created to disable basic authentication, even though EFT does not use this for our Web Client or Web Services.

In version 8 and later, add the advanced property below
to C:\ProgramData\Globalscape\EFT Server\AdvancedProperties.json:

{

"DisableHTTPBasicAuthentication":true

}

- true disables basic authentication;
- false enables basic authentication

Prior to v8:

HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\GlobalSCAPE Inc.\EFT Server 7.4\

Disallow (Shut Off) Basic Authentication for HTTPS

Type: BOOL

Value name: DisableHTTPBasicAuthentication

Values: Default = 0; 1 = disable basic authentication for HTTPS.

Restart Required: Yes
