Set Workspaces Send Email Port to Non-Default Value

THE INFORMATION IN THIS ARTICLE APPLIES TO:

- EFT v8.0.2.14 and later

DISCUSSION

This advanced property is used to specify the external port number that is appended to Workspaces emails, when not using the default of 443.

(This advanced property supersedes the old advanced property: PreserveSitePortForDefaultWorkspaceSendBaseUrl.)

Setting the value to any number greater than 0 (up to 65535) enables this advanced property and sets the port number.

Add the name:value pair to the AdvancedProperties.JSON file as described in the "Advanced Properties" topic in the online help for your version of EFT.

For example, to set the Workspaces external port number to port 465:

```
{
"ExternalLinkPortOverride":465
}
```
